DISSERTATION ABSTRACT

Suppose I ask you how many windows are on the outside of your house. A natural way to answer my question is to *imagine* the outside of your house from various angles, counting the number of windows in your mental image. Suppose now that I describe to you a car accident I witnessed on my way to work this morning. As I do so, it would be natural for you to imagine this event as I describe the various details. In cases like these, we exercise our ability to imagine the actual world, using mental imagery to put us in touch with the way things are in reality. Prior to reflecting on such examples, it's intuitive to associate the imagination with our ability to mentally transcend reality: to daydream, fantasize, and conjure up fictional worlds. But this obscures the fact that uses of imagination to cognize actuality are a common, core part of everyday mental life. My dissertation investigates the nature and epistemic significance of such uses of the imagination, both in our individual explorations of the world and in how we learn from other people.
